RESEARCH INTEREST

I am interested in designing scalable and task-aware time-series clustering methods for domain-specific applications, particularly in uncovering latent economic and behavioral patterns from real-world data. My current research applies these methods to small business revenue time series to detect patterns of urban migration and local economic vitality. I also aim to develop interpretable machine learning systems by integrating large language models that can assist in automating the explanation of complex temporal structures. Broadly, I seek to advance data-driven and adaptive analytics for high-dimensional, time-dependent datasets.
